NLP

python libraries for data science and analytics.

1) pandas - for data manipulation.
2) numpy - (numerical python) - numerical calculation.
3) matplotlib's pyplot - visualization.
4) Seaborn - visualisation.

data science.

5) Sklearn (sci-kit learn) - machine learning.
6) tensorflow with keras and pytorch.
deep learning.

Python programming.
It is a process of giving instructions to the computer to perform specific task.

→ 3 levels of programming.
1) binary level programming. (0 and 1)
2) Mid/ assembly level programming.
- It is not a user friendly language.
3) High level language.
eg: C, C++, python, java, SQL ... etc.

python:

It is a high level, interpreted (line by line), object-oriented, and instant progeamming lavgage.

→ features of python.
- Easy to learn.
- free and opensource.
- platform independent (it can support any operating system).
- Huge community support.
- Vast collection of libraries.
- It supports all kind of progeamming method.

application of python:

- web Application
- Gaming Application
- Desktop Application
- Data Analytics
- Data Science.
- AI
- Automation.
- IOT ... etc.

History of python.

Guido van Rossum is the developer of python.

- python 1 launched in 1991
- python 2 launched in 2000
- python 3 launched in 2008

Different Methods of print function.

1) print ("Good morning")
- Good morning.

2) name = "rijas"
age = 22
print ("my name is", name, "and my age is", age))
- my name is rijas and my age is 22.

3) name = "rijas"
age = 22
print ("my name is {} and my age
.format (name, age))
- my name is rijas and my age is

4) # fstring method
name = "rijas"
age = 22
print(f"my name is {name} and my age is {age}")
- my name is rijas and my age is 22.
